
Group: 44 | Quax Boardgame | Sprint 4

Launch and Play Instructions

System Requirements

To run the Quax game, the following software must be installed on the system:

- Java Development Kit (JDK) 24
- JavaFX SDK 25
- A system capable of running Java applications

The game is provided as a runnable JAR file together with the project source code.

Running the Game

To launch the Quax game, open a terminal or command prompt in the directory containing the JAR file and run the following command:

```
java --module-path "javafx-sdk-25/lib" --add-modules javafx.controls,javafx.graphics
-jar quax.jar
```

This command launches the JavaFX application and opens the Quax game window.
If the JavaFX library is in a different folder, the module path should be adjusted accordingly.

Game Overview

Quax is a strategy board game played on an 11×11 grid of octagonal tiles. In this version of the game, the human player competes against a bot player.

- Players place stones on the board in order to form a connected chain between their respective sides of the board.
- Black (Bot) aims to connect the top side of the board to the bottom side
- White (Player) aims to connect the left side of the board to the right side
- The first player to create a continuous connection between their designated sides wins the game.

Game Interface

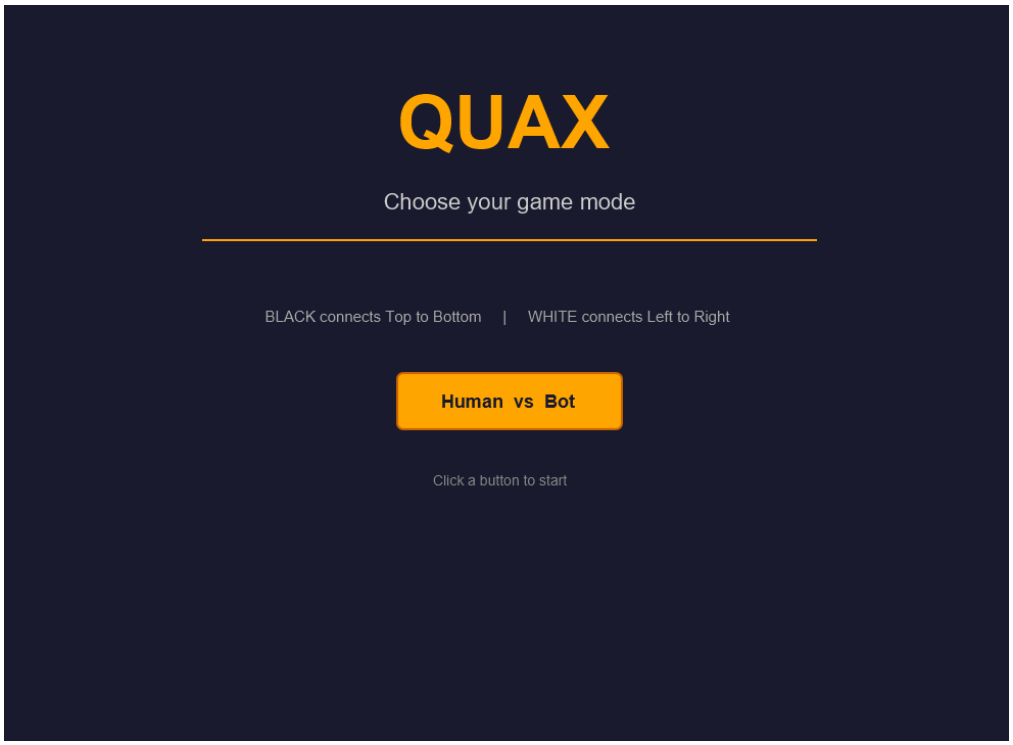
When the game launches, the main window displays:

- A small opening page with a button to start the game
- The 11×11 Quax board
- Octagonal tiles representing valid stone placement locations

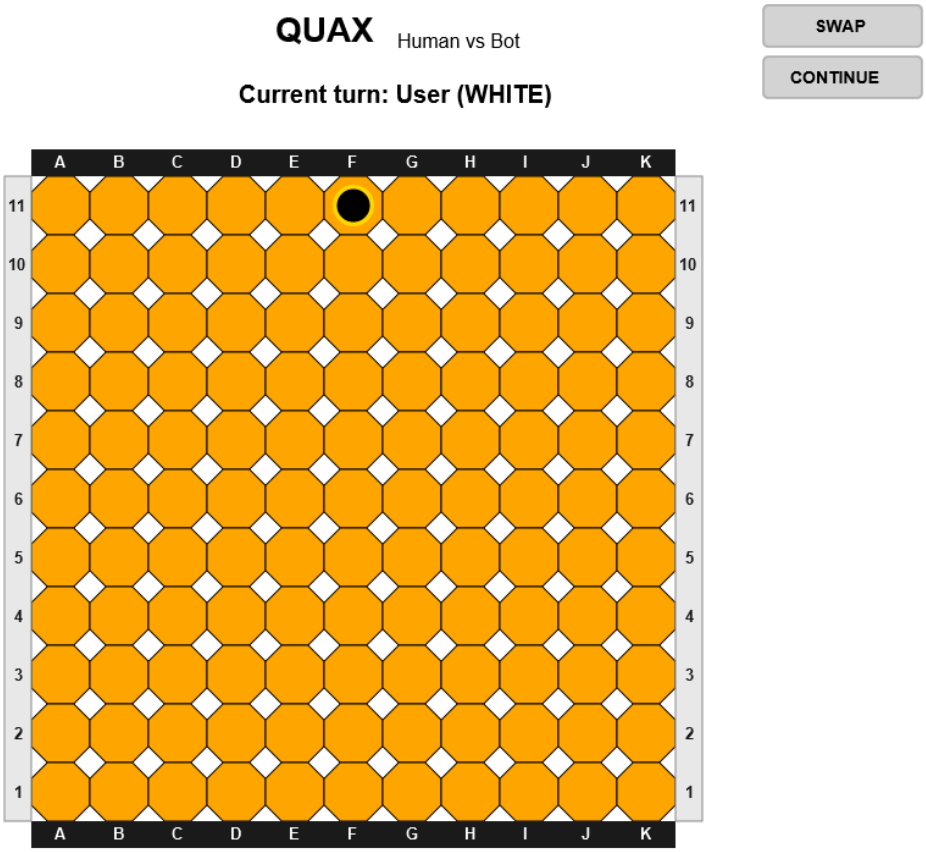
- Rhombic positions where rhombic tiles may be placed
- A turn indicator showing whose turn it is (human player or bot)
- The user interacts with the game by clicking on tiles using the mouse.

How to Play

- The game starts with short rules about the win detection, click the button to start!

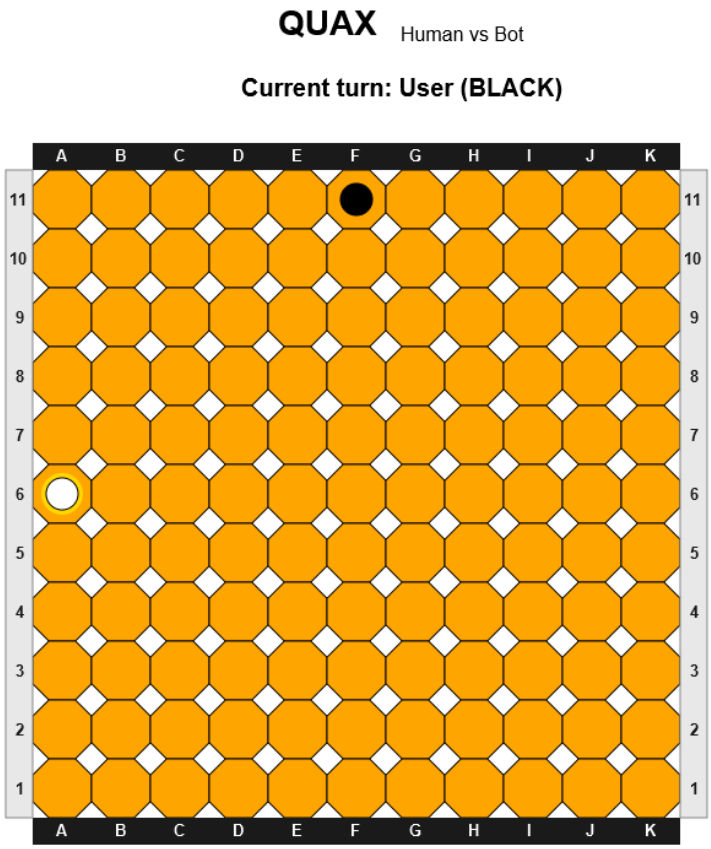


- The game begins with Black (the bot) making the first move.

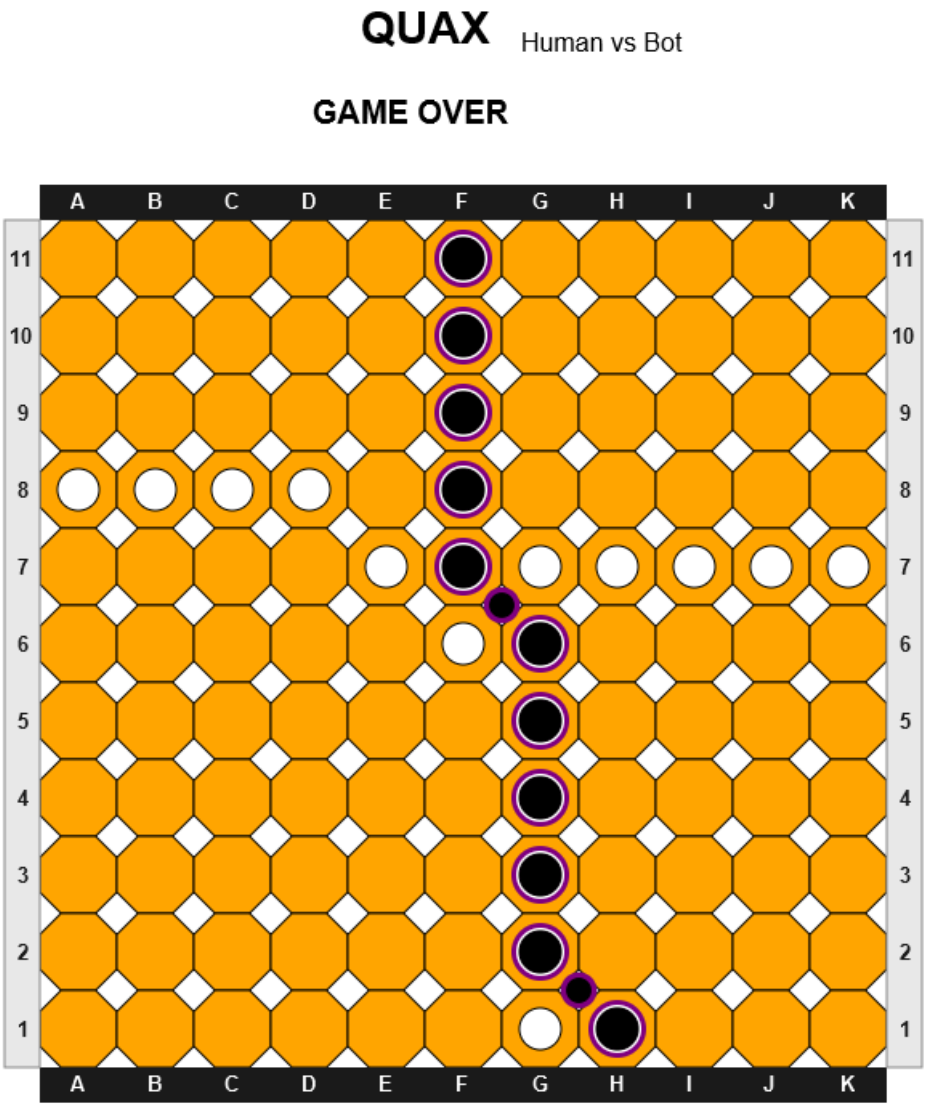


- Next, White (you, the player) is given the option to use the Pie Rule, either Swap colours or you can continue the game

- If you decide to swap, the bot will make the next move as White, and you can place your tile afterwards as Black



- Instead, if you decide to continue, then you may place your White tile
- You and the bot will continue to play until a winning chain is detected
- Once someone wins, the game displays a highlighted winning chain and displays the winning colour, you cannot place anymore tiles after this.



Troubleshooting

If the game does not launch correctly, check the following:

- Ensure that JavaFX is correctly installed
- Ensure that the JavaFX module path in the command is correct
- Ensure that the correct JDK version is installed
